

CMSC828T

Vision, Planning And Control In Aerial Robotics

Search Techniques for Planning

Search: What and Why?

- Once we have a map, a start point and a goal point, we can “search” through the map on how to get from start to goal.
- Graph-based search methods:
 - Uninformed Search
 - › No information obtained from the environment
 - › BFS, DFS
 - Informed Search
 - Evaluation function based
 - Efficient
 - May use heuristics (A*, D*)

CMSC828T

Vision, Planning And Control In Aerial Robotics

Grid-Based Search (Dijkstra, A*)

A* Solved Example

| Node Data |
|---------------------|
| H Value (Heuristic) |
| G Value (Move Cost) |
| F Value (G+H) |
| Parent (Node From) |

| Lists |
|----------|
| Open<> |
| Closed<> |

| | | | | |
|----|--|----|--|----|
| 1 | 2 | 3 | 4 | 5 |
| 6 | 7  | 8 | 9 | 10 |
| 11 | 12 | 13 | 14 | 15 |
| 16 | 17 | 18 | 19 | 20 |
| 21 | 22 | 23 | 24  | 25 |

Computing Heuristic Values

| Node Data |
|---------------------|
| H Value (Heuristic) |
| G Value (Move Cost) |
| F Value (G+H) |
| Parent (Node From) |

| Lists |
|----------|
| Open<> |
| Closed<> |

| Node Data (7) |
|---------------------|
| H = 5 |
| G Value (Move Cost) |
| F Value (G+H) |
| Parent (Node From) |

| Node Data (16) |
|---------------------|
| H = 4 |
| G Value (Move Cost) |
| F Value (G+H) |
| Parent (Node From) |

Computing Heuristic Values

| Node Data |
|---------------------|
| H Value (Heuristic) |
| G Value (Move Cost) |
| F Value (G+H) |
| Parent (Node From) |

| Lists |
|----------|
| Open<> |
| Closed<> |

Computing Movement Cost

$$G = G_{parent} + MoveCost$$

| Node Data |
|---------------------|
| H Value (Heuristic) |
| G Value (Move Cost) |
| F Value (G+H) |
| Parent (Node From) |

| Lists |
|----------|
| Open<> |
| Closed<> |

| | | | | |
|------|------|------|------|------|
| 1 7 | 2 6 | 3 5 | 4 4 | 5 5 |
| 6 6 | 7 5 | 8 | 9 3 | 10 4 |
| 11 5 | 12 4 | 13 3 | 14 2 | 15 3 |
| 16 4 | 17 | 18 2 | 19 1 | 20 |
| 21 3 | 22 2 | 23 1 | 24 | 25 1 |

Open, Closed List

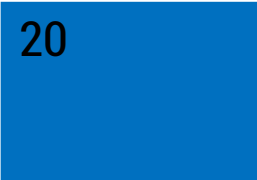

| | | | | |
|------------|--|------------|---|------|
| 1 7 14 21 | 2 6 10 16 | 3 5 14 19 | 4 4 | 5 5 |
| 6 6 10 16 | 7 5 0  | 8 | 9 3 | 10 4 |
| 11 5 14 19 | 12 4 10 14 | 13 3 14 17 | 14 2 | 15 3 |
| 16 4 | 17 | 18 2 | 19 1 | 20 |
| 21 3 | 22 2 | 23 1 | 24  | 25 1 |

| Lists |
|------------------------|
| Open<1,2,3,6,11,12,13> |
| Closed<7> |

Note
Nodes 1,2,3,6,11,12,13 have Node 7 as parent

Open, Closed List

| | | | | |
|------------|---|--|---|--|
| 1 7 14 21 | 2 6 10 16 | 3 5 14 19 | 4 4 | 5 5 |
| 6 6 10 16 | 7 5 0  | 8  | 9 3 | 10 4 |
| 11 5 14 19 | 12 4 10 14  | 13 3 14 17 | 14 2 | 15 3 |
| 16 4 | 17  | 18 2 | 19 1 | 20  |
| 21 3 | 22 2 | 23 1 | 24  | 25 1 |

| Lists |
|---------------------|
| Open<1,2,3,6,11,13> |
| Closed<7,12> |

Update Rule

- Once at new node, we check adjacent nodes as usual.
- If the G cost of previously parented node is less now, we update parents for that node.
- Otherwise, leave as is.
